SUGGESTED METHOD FOR RIGGING AIRCRAFT SKIS.

1. Install skis on landing gear, torque axle nut and cotter key.
2. With A/C in the three-point position, raise the heel of the ski to between 8 and 10 degrees nose-down. (Fig. 1) This can be done with a prop protractor installed.
3. Adjust front limit cable down at this position (8 to 10 degrees) to stop ski movement.
4. Raise tail of A/C to level flight position. (Fig. 2) Refer to maint manual or specs for correct method of leveling A/C.
5. Adjust ski to 1 1/2 degree nose up position and adjust rear check cable to limit the nose-up attitude. Much care should be used to adjust the nose-up position.

6. While A/C is in flat attitude (level), set preload on bungee. Refer to part 43 for correct preload.

7. Suggested method for rigging the opposite ski:

- a. Remove rigging from the rigged ski
- b. Obtain several nails and a length of 2 X 4 about 6'
- c. Put nail into surface of 2 X 4 at one end
- d. Starting with the rear check cable, loop thimble over the nail, pull tight and put a nail in the 2 X 4 thru the other thimble at the other end of the cable. Remove cable from nails. Now loop the opposite rear check cable over one nail and the opposite end over the second nail and adjust so both cables have the same tension.
